

Preparing Your Christmas Tree

- Once home, unwrap your tree from the netting.
- Lift the tree a few inches off the ground and drop it down on the stump end to fluff out the tree.
- Make a straight cut across the tree trunk, about 2 inches from the original cut. This helps the uptake of water and nutrients.
- Place a Tree Skirt/Removal Bio-Bag™ under your tree before putting in the stand.
- Display in water stand with at least one gallon capacity within 30 minutes after making the cut.
**Place your tree in a bucket of water with Tree Life™ nutrient, if you plan to keep it outside until you are ready to display it indoors. Keep water level well above the new cutline.

Tree Care

- Keep water level above the base of the tree at all times.
 - Add Tree Life™ nutrient to help maximize the life and beauty of your tree.
 - Check the water supply daily; add fresh water and Tree Life as needed.
